MDK (IgD)

1. MDK

1.1 MDK

MDK (IgD) is a marker of disease activity in juvenile idiopathic arthritis (JIA). It is a type of immunoglobulin (Ig) that is produced by B cells. MDK is found in the serum of patients with JIA and is associated with disease activity. The presence of MDK in the serum is a sign of active disease and is used to monitor disease activity and response to treatment.

1.2 MDK

MDK is a marker of disease activity in JIA. It is a type of immunoglobulin (Ig) that is produced by B cells. MDK is found in the serum of patients with JIA and is associated with disease activity. The presence of MDK in the serum is a sign of active disease and is used to monitor disease activity and response to treatment.

1.3 MDK

MDK (IgD) is a marker of disease activity in juvenile idiopathic arthritis (JIA). It is a type of immunoglobulin (Ig) that is produced by B cells. MDK is found in the serum of patients with JIA and is associated with disease activity. The presence of MDK in the serum is a sign of active disease and is used to monitor disease activity and response to treatment.

1.4 MDK

MDK (IgD) is a marker of disease activity in juvenile idiopathic arthritis (JIA). It is a type of immunoglobulin (Ig) that is produced by B cells. MDK is found in the serum of patients with JIA and is associated with disease activity. The presence of MDK in the serum is a sign of active disease and is used to monitor disease activity and response to treatment.

1.5 MDK

MDK (IgD) is a marker of disease activity in juvenile idiopathic arthritis (JIA). It is a type of immunoglobulin (Ig) that is produced by B cells. MDK is found in the serum of patients with JIA and is associated with disease activity. The presence of MDK in the serum is a sign of active disease and is used to monitor disease activity and response to treatment.
